EV FireSafe

Enhancing safety for emergency responders at electric vehicle fires

Supported by:

Australian Government
Department of Defence

In partnership with:

We're researching

EV lithium ion
battery fires

+

connection to
energised charging

What do they mean for
emergency responders?

What additional risks do
emergency responders face?

It all started with a bush fire

“The day’s not over. It’s still hot.”

FIRE EMERGENCY

RESIDENTS WARNED TO EVACUATE

9NEWS NOW

Fire burning at Little River, in Victoria's south-west

1 / 20   Prev Next 

Betty the Tesla Model 3

Experiencing EVs is one of the best ways to reduce firefighter FUD

EV LiB fires are very rare

In passenger plug-in EVs, we have verified*:

187 EV traction battery fires globally, 2010 -today

+ 24 currently being cross checked

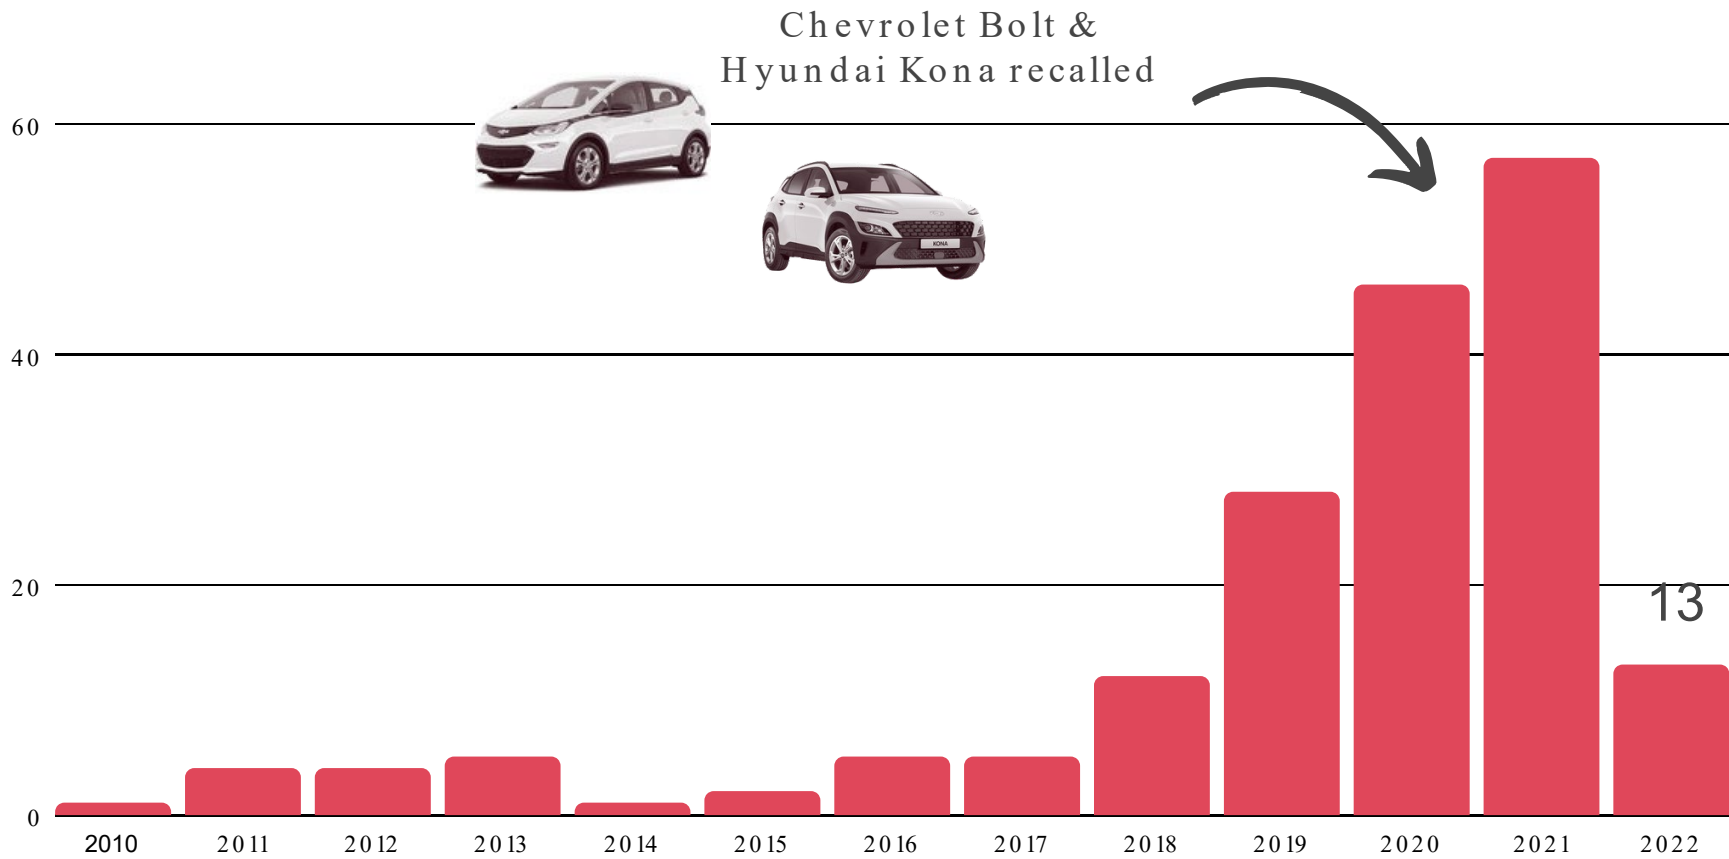

'In the world of clean energy, few areas are as dynamic as the electric car market. We estimate there are now **around 16 million electric cars** on the road worldwide...'

International Energy Agency, January 2022

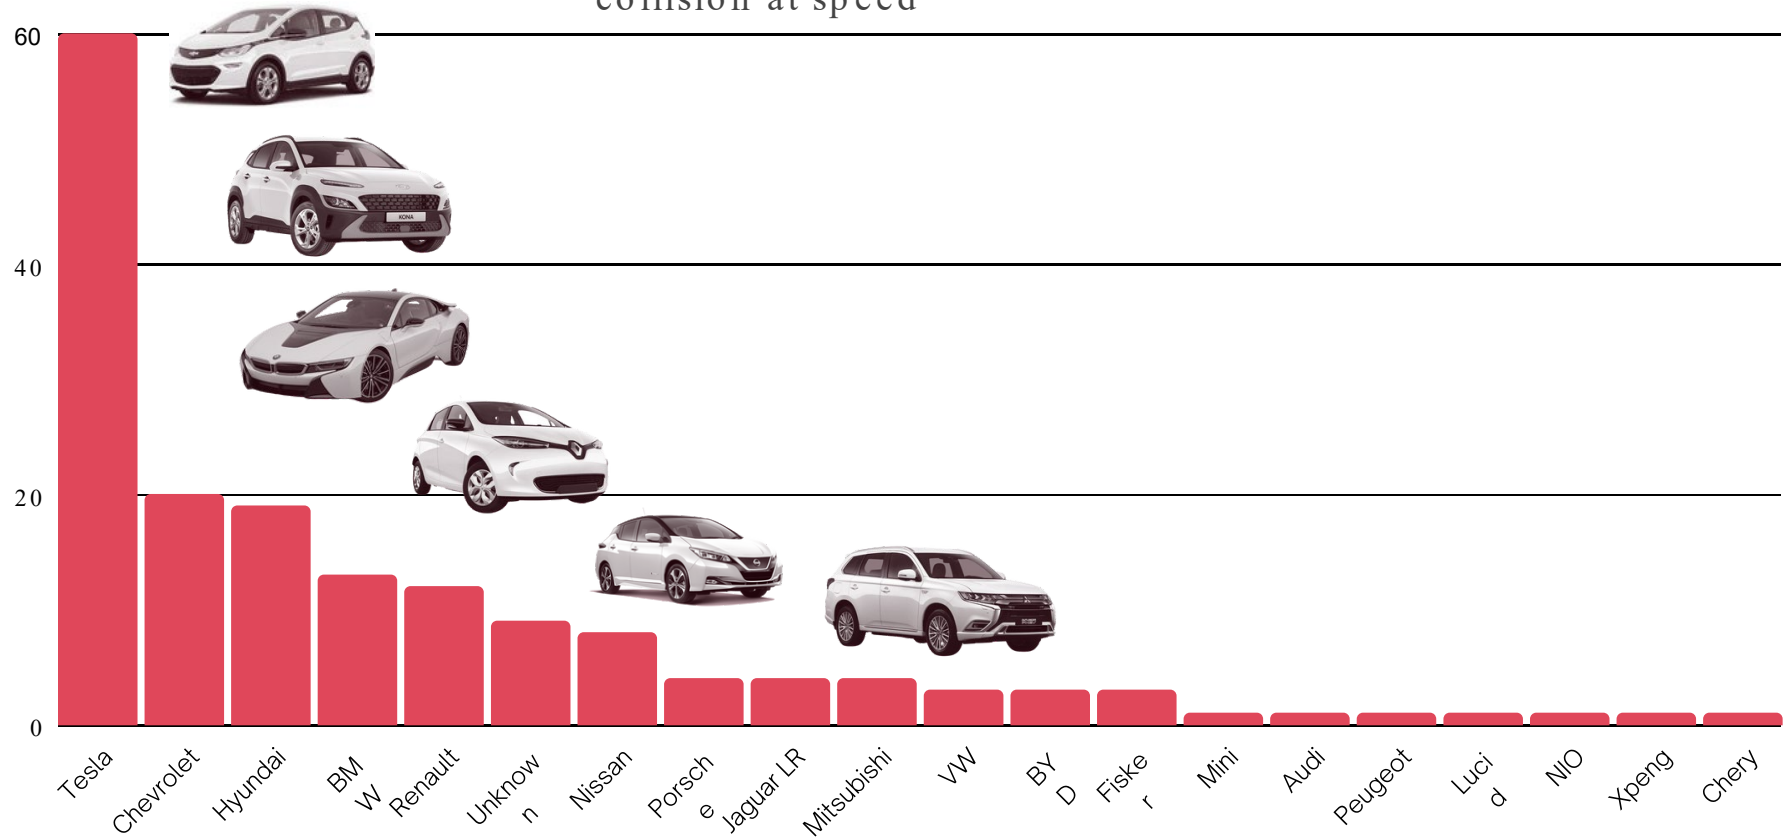

EV fires by year

EV fires by manufacturer

Most number of EVs
on the road
Most number of
'collision at speed'

Causes of battery cell abuse

Overheating	1.57%
Submersion	1.57%
External fire	2.31%
Arson / malicious	2.31%
Workshop / repair	3.08%
Collision / debris	18.90%
OEM battery fault	18.90%
Unknown	29.13%

*Data current November 2021

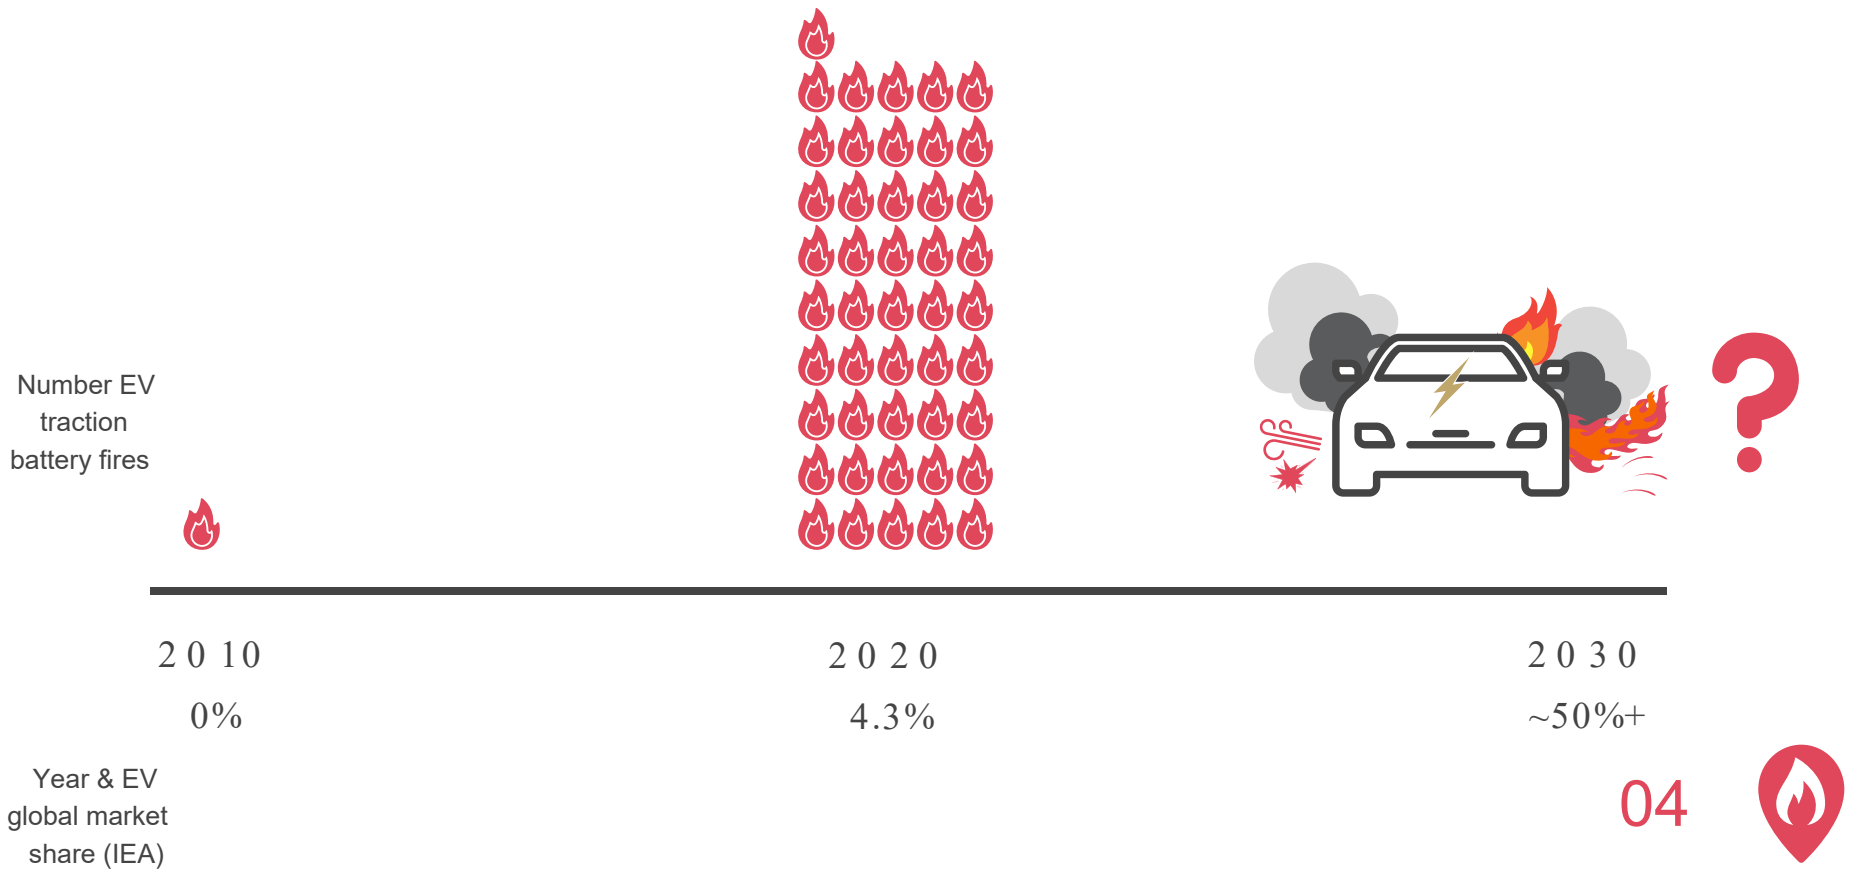

^Percentage of incidents EVFS studied

EV & fire projections

'The average age of **electric vehicles in the US** is **3.9 years** of age and has been hovering between 3.8 and 4.1 years since 2016...'

IHS Markit, January 2021

EVs in Australia

EV ownership* is concentrated in capital & major cities, but there are now EVs in every Australian region

~70 %

compound annual growth
rate of EVs since 2010

*Doesn't include hydrogen
fuel cell vehicles!

EVs in Victoria

'The state of Victoria is Australia's largest and most important electric vehicle market, with the most electric vehicle purchases in Australia between 2011 and 2021.'

Electric Vehicle Council, State of EVs Report 2021

At April 2022

Forecast 2030 for
passenger EVs

Total number of **all** vehicles registered in Victoria, end 2021: 5.1 million

Age of ICE is over

Brands with EVs currently available in Australia

EV brands coming in 2022/3

Brands not electrifying (yet)

New risks & challenges

Battery pack construction

An EV traction battery pack is typically constructed like this:

Lithium ion
battery cell

Multiple cells make a
battery module

Multiple modules
make a battery pack,
which is enclosed in
protective battery
casings

Battery pack construction

The traction battery supplies power for vehicle momentum & is usually located beneath the vehicle, along the floor pan

EV traction battery pack

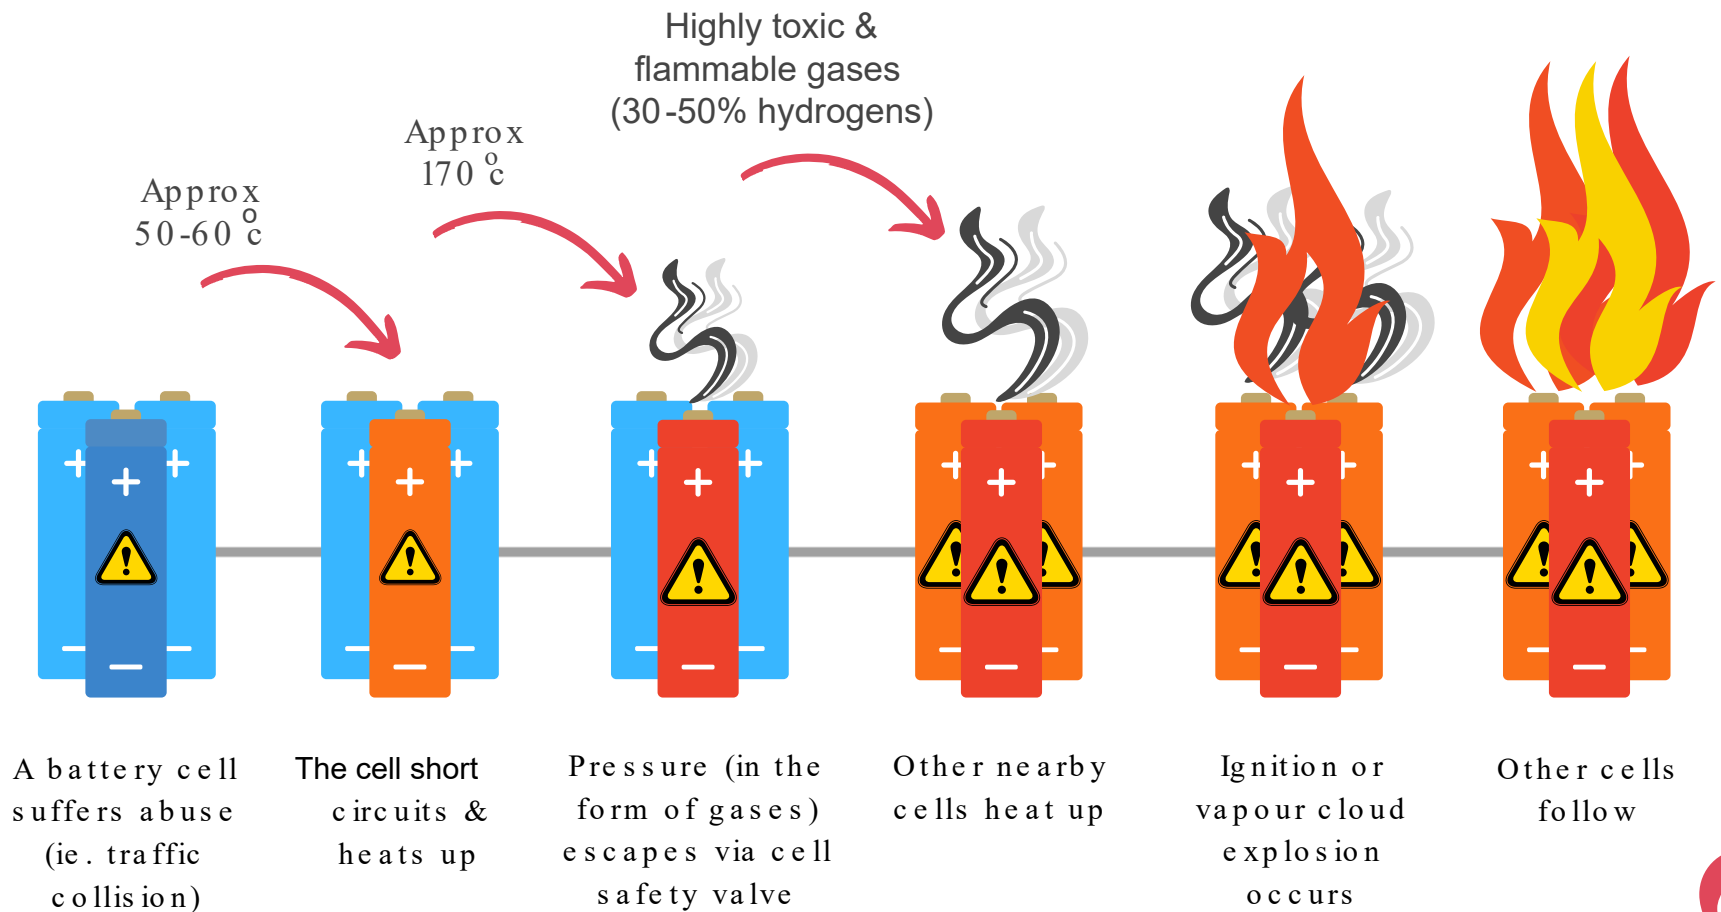

Thermal runaway

An **unstable chemical process** that is difficult to bring under control

Thermal runaway

Thermal runaway occurs when a battery cell suffers abuse, short circuits, heats up & bursts.

From outside the EV

From an emergency responder perspective, thermal runaway looks & sounds like this

Dark vapour cloud,
light vapour cloud
(it's NOT smoke)

Popping - blast caps
Hiss/whistle - gas venting
Projectiles - cell debris

At this point, one of two things will occur

Ignition
Jet like, directional flames

Vapour cloud explosion
Violent deflagration

~90%

~10%

2020-05-01 11:21:49

Camera 01

Vapour cloud explosion

VCE occurs ~10 % of time

Total of 18 VCE incidents globally since 2010:

64.3%

Underground /
enclosed space

35.7%

Open air

4 incidents verified of:

- vapour cloud explosion
- in an enclosed space
- while connected to energised charging

EV fire suppression

It doesn't actually take much water to cool the battery pack...the problem is getting it directly onto the cells to cool them down

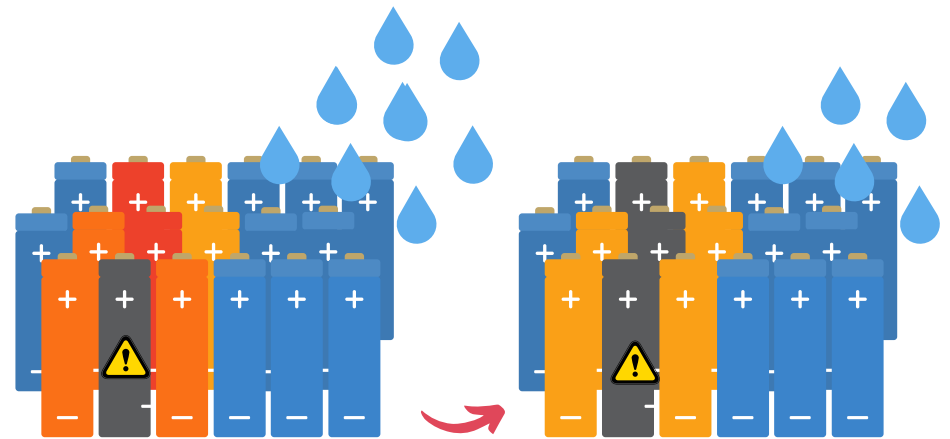

EV fire suppression

A stream of water onto the underside of the EV will dissipate heat = slow & stop thermal runaway

Cooling battery cells within a pack may take several hours

Suppression = time, resources

Best case

Worst case

10 m in

3-5 hours (>50 hours to clear highway)

1,000 L

110,000 L

EV fires at charging

Of all incidents, we found:

26.15%

were connected to energised charging (34 incidents)

4.62%

had been disconnected from energised charging within 60 minutes (6 incidents)

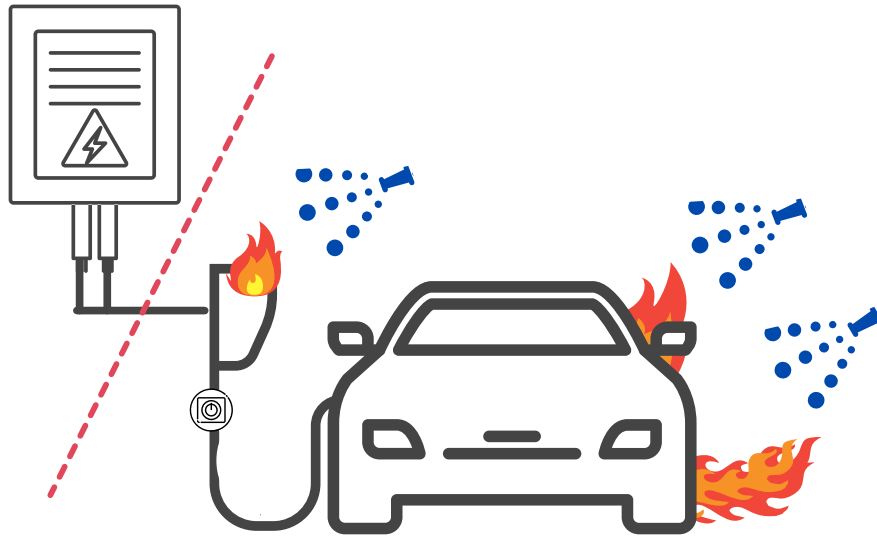

Charging wasn't necessarily the cause of fire, but consideration needs to be given to truck & water access at charging hubs

If connected to charging

AC EV charging (7/22kW)

In theory, electrically compliant units installed to AS3000 will cut between car & distribution board
Average unit cost: \$800-\$1500

DC EV charging (25/350kW)

In theory, electrically compliant units installed to AS3000 will cut between unit & car
Average cost: \$50,000 - \$750,000

Best practice

Treat as an energised electrical fire & follow SOPs

Don't touch anything until distribution board is located & cut

Reignition is a risk

- In 6 cases Damage caused to tow truck
- In 4 cases Injuries to drivers, one hospitalised

Reignition = multiple cells abused

Reignition occurs when multiple battery cells are abused, but short circuit & go into thermal runaway at different times. The stranded energy inside the battery pack supports a second ignition.

Reignition occurred in ~10 % of incidents

You're a vital link in the emergency response chain

- Understand battery pack construction
- Learn signs of thermal runaway
- Make charging hubs safer
- Conduct visual inspections
- Know where ERGs can be found
- Be alert, not alarmed

Battery pack construction

Helps us understand where a battery problem is located.

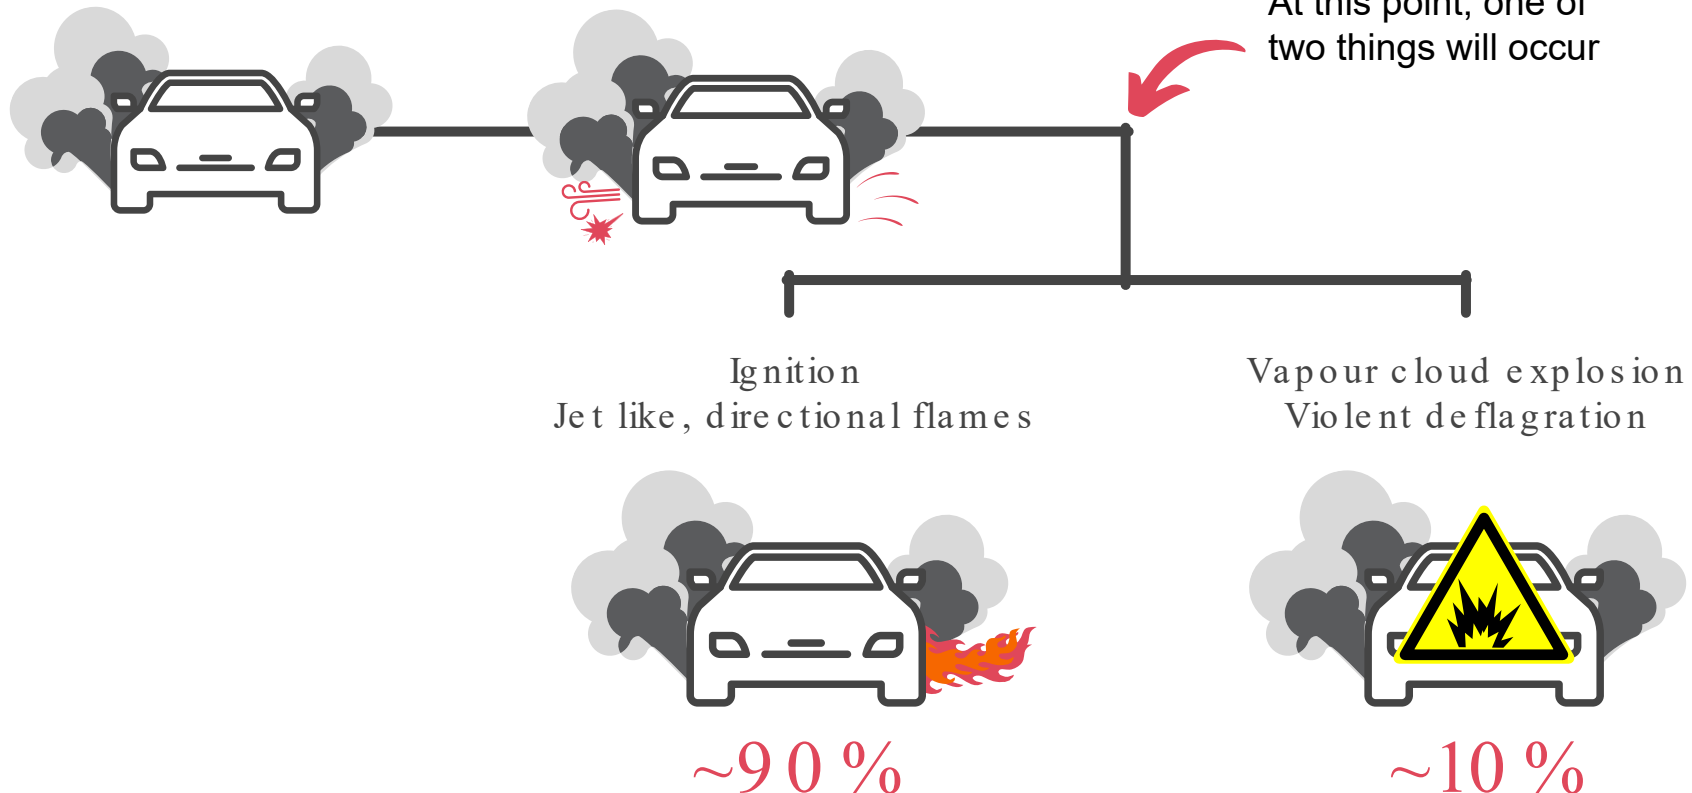

Know signs of thermal runaway

If these are seen or heard, EVACUATE the area immediately & call 000 for emergency assistance.

Dark vapour cloud,
light vapour cloud
(it's NOT smoke)

Popping - blast caps
Hiss/whistle - gas venting
Projectiles - cell debris

At this point, one of two things will occur

Safer charging hubs

Help emergency responders more effectively manage an incident involving an EV

Choose electrically compliant charging equipment & have it professionally installed

- RCM Tick & ask for proof of electrical compliance
- Install to AS 3000 Appendix P
- Review manufacturer usage instructions
- Know where the isolation switch is
- Regularly inspect for wear & tear

Consider your charging location

- Can a truck access the site?
- Where is the nearest fire hydrant?
- Where is the distribution board that will cut power supply & who would do that?
- Locate away from flammable infrastructure
- Where will gases vent to?
- Where will water run off?

If you have multiple charging units being installed, or have fast or rapid charging DC units, it may be a good idea to contact your local brigade or state fire agency to discuss preparing a Pre Incident Plan (PIP) or updating an existing one.

Visual inspections

Ask your manufacturer to provide you with a list of what to look for when conducting a visual inspection. This may include:

- Bulging or dark patches in the battery pack casing
- Damage to the vehicle body
- Damage to orange high voltage cables or components
- Wear & tear on the portable EVSE cables

A burnt EV
showing area on
the battery pack

Know your ERGs

Your EV Emergency Response Guide is a vital tool for helping emergency responders manage an incident involving an electric vehicle.

The EV manufacturer can send this to you &/or you can do an online search.

Please note that Emergency Response Guides should follow ISO 17840 which provides standardised information for emergency agencies.

Images from the Tesla Model 3 Emergency Response Guide.

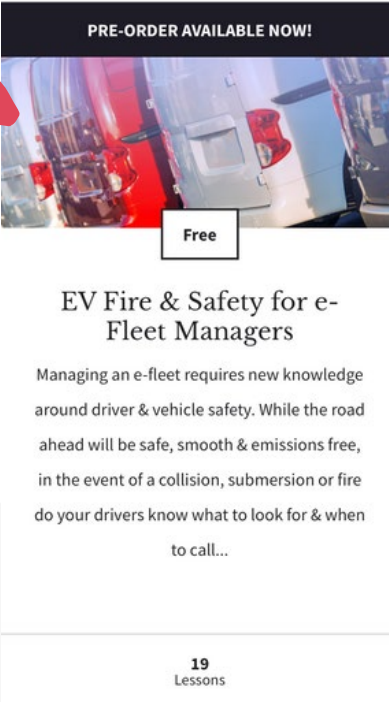

Be alert, not alarmed

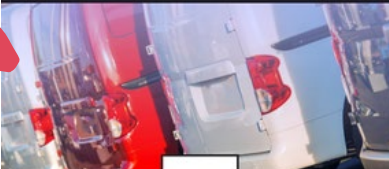

EV battery fires are very rare. You can keep up to date with information, research & testing results as we progress our project.

Complete our short online EV Fire Safety for e-Fleet Managers course (launching mid-May).

Join our mailing list & keep up to date with the latest!

EV Fire & Safety for e-Fleet Managers

Managing an e-fleet requires new knowledge around driver & vehicle safety. While the road ahead will be safe, smooth & emissions free, in the event of a collision, submersion or fire do your drivers know what to look for & when to call...

So much to learn & test...

There are a range of other issues we haven't discussed today:

- EV identification & immobilisation
- HV system isolation
- Electrocution
- Stranded energy
- Extrication
- Vapour cloud venting underground
- Water run off
- Flame intensity & temperature
- Fire spread through buildings
- Induction & bi-directional charging

Eg: most surprising finding from our research - electrocution risk is lower than anticipated

Direct stream of water onto damaged HV cables, components or battery

Submersion

Extrication of driver / passengers

Stranded energy - remaining SoC in traction battery

...& knowledge to share...
